**HUBUNGAN FAMILY CENTER CARE DENGAN DAMPAK HOSPITALISASI
PADA ANAK TODDLER DI RUANG RAWAT ANAK RUMAH SAKIT IBU
DAN ANAK BANDA ACEH**

ABSTRAK

Hospitalisasi merupakan suatu kondisi yang tidak menyenangkan bagi anak karena dapat memberikan efek kecemasan akibat perpisahan, kehilangan kendali, cedera tubuh dan nyeri. Oleh karena itu, dibutuhkan peran serta keluarga untuk bekerjasama dengan perawat sebagai pemberi perawatan melalui asuhan keperawatan dengan pendekatan Family Center Care. Family Center Care adalah hubungan kerjasama yang melibatkan orangtua dan partisipasi orangtua untuk perawatan anak. Prinsip Family Center Care didasarkan saling menghormati dan bekerjasama antara keluarga dan perawat sehingga dapat terbina hubungan kemitraan. Tujuan penelitian ini adalah untuk mengetahui hubungan Family Center Care dengan dampak hospitalisasi pada anak toddler di Ruang Rawat Anak Rumah Sakit Ibu dan Anak Banda Aceh. Jenis penelitian ini bersifat correlation research dengan desain penelitian menggunakan pendekatan cross sectional study. Jumlah populasi dalam penelitian ini adalah 102 anak dan teknik pengambilan sampel dengan metode purposive sampling sebanyak 50 responden. Alat pengumpulan data yang digunakan adalah kuesioner dengan cara wawancara terpimpin. Uji analisis menggunakan Chi-Square. Hasil analisa data secara umum diperoleh ada hubungan Family Center Care dengan dampak hospitalisasi ($p\text{-value} = 0,000$), dan secara khusus diperoleh ada hubungan Family Center Care dengan kecemasan akibat perpisahan ($p\text{-value} = 0,001$); kehilangan kendali ($p\text{-value} = 0,000$); cedera tubuh dan nyeri ($p\text{-value} = 0,005$). Saran peneliti kepada perawat yang bertugas di ruang rawat anak agar dapat memampukan dan memberdayakan keluarga dalam perawatan anak melalui asuhan Family Center Care.

WARD OF IBU DAN ANAK HOSPITAL OF BANDA ACEH

ABSTRACT

Hospitalization is an unpleasant condition for children because it gives the effect of anxiety of leave-taking, loss of control, and body injury and pain. Therefore, it needs family participation to cooperate with the nurses through family-centered care. Family-centered care is a partnership that involves parents and parent participation for children care. The principles of family-centered care are based on respectfulness and cooperativeness between the family and the nurses so that a partnership can be built. The purpose of this study was to find out the correlation between family-centered care and the impact of hospitalization for toddlers in Children's Ward of Ibu dan Anak Hospital of Banda Aceh. This study was correlational research with cross sectional design. The population of this study was 102 children and the sampling technique used was purposive sampling with the number of sample was 50 respondents. The instrument of data collection used was questionnaire with guided interview. The data were analyzed by using chi-square test. The results of data analysis generally showed that there was correlation between family-centered care and the impact of hospitalization ($p\text{-value} = 0,000$) and specifically showed that there was correlation between family-centered care and anxiety of leave-taking ($p\text{-value} = 0,0001$); loss of control ($p\text{-value} = 0,000$); and body injury and pain ($p\text{-value} = 0,005$). It is suggested for the nurses in the Children's Ward to be able to empower the family in children care through family-centered care.
